

Joint Statement

Stop NEWREP-A: The Research Plan Ignores International Rules

~A statement against the departure of research whaling fleets ~

Content

The government of Japan announced that it would abide by the international judgement in response to the International Court of Justice ruling against the Antarctic research whaling (JARPAII) that came out last March. However, on October 6th this year the government sent a letter to the UN to amend its declaration to abide by the ICJ agreement, to avoid having further lawsuits from other countries. The government is now forcing ahead with more Antarctic research whaling under its new plans.

We demand the government respect the international rules and not carry out any new research whaling program.

Background and Rationale

<The objective behind the declaration to amend the ICJ compulsory jurisdiction agreement>

The ICJ ruled in March 2014 that Japan's research whaling program (JARPAII) was not designed for the purposes of scientific research, prohibiting Japan to grant any permit to implement the program. In response to the court decision, Japan put together NEWREP-A, which is planned to launch this November. This new plan is the same plan that the expert panel of the International Whaling Commission concluded this January did not demonstrate the need for lethal sampling. This report was further supported by 44 scientists at the IWC Scientific Committee held in May.

It is easy to surmise that the government recognized the possible illegality of this new program against international laws, and in order to avoid having challenged further at the ICJ over NEWREP-A it decided to amend its declaration to abide by the jurisdiction of the ICJ. In this new program, the research area has been expanded and 333 minke whales are planned to be caught annually, adding up to about 4000 whales total over the 12-year period.

The international community is showing strong opposition to this move. For example, the Australian Federal Court this November fined Kyodo Senpaku 1 million Australian dollars (87.5 million yen) for killing whales within the Antarctic whale sanctuary.

<No companies want to start commercial whaling in Antarctica>

Resumption of commercial whaling is the objective of Japan's research whaling. However, the whaling industry that once existed is no longer interested in restarting an unprofitable whaling business in the

Antarctic. The demand for whale meat is limited in Japan, and the current system for supplying whale meat cannot operate without government subsidies.

<Increasing subsidies and decreasing actual catch>

The initial government subsidy to research whaling at the onset of the program was 500 million yen. The amount is increasing every year, and the current amount is 3.1 billion yen. Not only this, but it also received an additional 4.5 billion yen last term, from the Fisheries Agency under the grant program called “Profitable Fisheries” designed to “vitalize Japan's fisheries.” These large sums of tax payers' money were spent presumably to help the deficit-laden Institute of Cetacean Research, the main body in charge of implementing the research, which is suffering from the shrinking market for whale meat.

It is clear that the operation that requires going out to distant international waters cannot make a good business.

<Seas at risk>

One of the biggest problems discussed at various international organizations such as the UN is the critical state of the ocean. The oceans and seas cover 70% of the earth, circulating water, moderating the climate, providing food and more, making them vital to human existence. However, the same oceans and seas are now faced with drastic changes due to problems such as acidification, pollution, and overfishing, including illegal fisheries. Sharing a sense of urgency, many countries are now concerned about how to return the ocean to a healthier state, making these issues international.

Our country Japan is surrounded by the ocean, and has been thriving due to the wealth of the sea. The health of the ocean then must be the utmost concern to us, more so than most countries. However, despite the fact that Japan is responsible for many cases of decline in marine resources, the government has failed to address these issues.

We, not only being Japanese, but also citizens of the Earth, cannot dismiss such an announcement by the government like the one made to the UN last month that ignores international agreements.

We strongly demand that the government not start any new research whaling programs, and instead take on new measures that contribute to ocean conservation.
